

What is claimed is:

1. A display unit comprising:

a display section;

5 a display driver IC among a plurality of types of display driver ICs capable of driving and controlling the display section; and

an MPU sending a command and display data to the display driver IC,

10 wherein the display driver IC comprises:

an ID setting circuit; and

a command decoder decoding the command from the MPU,

wherein the MPU has a storage section for storing a plurality of types of control contents for a plurality of types of display driver ICs including the display driver IC,

wherein the MPU sends an ID monitor command to the display driver IC when the MPU reads an ID from the ID setting circuit,

20 wherein the display driver IC sends ID information from the ID setting circuit to the MPU in accordance with a signal generated by the command decoder decoding the ID monitor command, and

wherein the MPU reads the ID information so as to control the display driver IC among a plurality of types of display driver ICs according to the corresponding control contents in the storage section among the plurality of

types of control contents for a plurality of types of display driver ICs including the display driver IC.
